

What Gateways to Choose

Automated Configuration

The only fully plug & play supported gateways come from [Audiocodes](#). There are different models, including the TP-260, which is a PCI card. sipXecs supports all Audiocodes gateways including FXS, FXO and T1/E1. Do not choose a gateway that offers both FXS and FXO ports on the same unit. Since these two port types are handled differently in sipXconfig, it is not a good choice.

Manual Configuration

We also have many users using [Patton Electronics SmartNode gateways](#) or [Cisco Routers as gateways](#). There is no config support for these devices so they need to be manually configured.
