

Adding Users with PHP

This uses the sipXconfig SOAP API.

Creating a sipXecs user with PHP

```
<?php>

addSipXecsUser($ext,$fname,$lname,$pin,$alias);

function addSipXecsUser($ext,$fname,$lname,$pin,$alias)
{
    $client = new SoapClient("https://sipx:8443/sipxconfig/services/UserService?wsdl", array('login' =>
"superadmin", 'password' => "your_sipxecs_superadmin_pw_here", 'authentication' => SOAP_AUTHENTICATION_DIGEST));

    try {
        //this is the data from the <complexType name="User"> field -- it's all optional so make sure
the single quotes match the wsdl then poulate the doubles with whatever you want
        $userdata = array('userName'=>$ext, 'lastName' => $lname, 'firstName' => $fname,
'sipPassword'=>randomKey(), 'emailAdress'=>$alias."@yourdomain.com", 'aliases'=>$alias);

        //probably won't change this line - the userdata is from the array above, the pin is generated
by the end user as their voicemail key
        $user = array('user'=>$userdata, 'pin'=>$pin);

        //make the soap call
        $client->__soapCall("addUser",array($user));
    }
    catch (SoapFault $soapFault)
    {
        $error=true;
    }

    //post soap functionality
    if($error==true)
    {
        return "error";
    }
    else
    {
        addForwarding($ext,$ext,$pin);
        return "success";
    }
}
</php>
```
