

How to import contacts from Google Accounts

A new 4.2 sipxecs feature is the ability to import contacts from Google Accounts. This can be done from both admin and user portal - admin can import contacts in a public phonebook (shared by multiple users within an user group) while a regular user can import contacts only to his/her private phonebook.

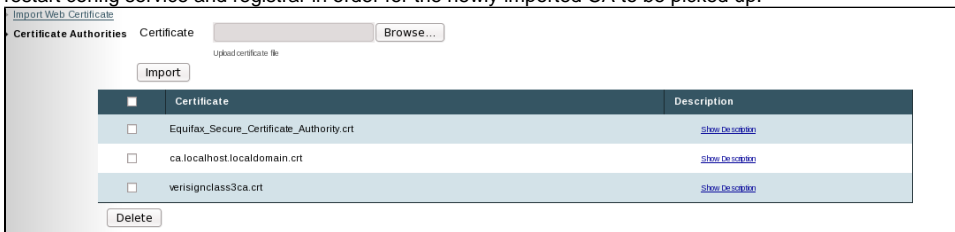

Prerequisite:

There are some prerequisites needed in order to use Google Account import feature:

- if running sipXconfig from behind a proxy without authentication, the admin should make sure that the ports are accessible
- Verisign Class 3 CA should be imported in sipXconfig trusted store (so sipXconfig to recognize CA). This can be accomplished either within sipXconfig (recommended) or using JDK's keytool utility
- **import certificate within sipXconfig:** navigate to System > Certificates > Certificate Authorities tab. Download attached [verisignclass3ca.crt](#) file and use it to upload in "Certificate" field. After importing, the certificate gets validated and a screen like the one below is displayed:

After the "Keep" button is accessed, Verisign Class 3 CA is added and displayed in sipXconfig known CA's list. You will also be prompted to restart config service and registrar in order for the newly imported CA to be picked up.

- **import certificate using keytool utility:** one can directly use keytool utility to import the attached [verisignclass3ca.cer](#) certificate

```
keytool -importcert -alias equifaxsecureca -file verisignclass3ca.cer \
```
